CMG Motors

HGA series
includes new mining series

A Regal Brand

REGAL

“We convert power into motion to help the world run more efficiently”

BUSINESS PURPOSE

ABOUT US

Regal Beloit Corporation is a leading manufacturer of electric motors, mechanical and electrical motion controls and power generation products serving markets throughout the world. Regal Beloit is headquartered in Beloit, Wisconsin, and has manufacturing, sales and service facilities throughout the United States, Canada, Mexico, Europe and Asia.

Regal Australia brings together the strength and experience of three of Australia’s leading suppliers of engineered industrial products. CMG, OBA and Transmission Australia are now in a position to offer industry an unparalleled range of products under the Regal Australia banner.

Our products are efficient and innovative; they conform to Australian design, performance and engineering standards. Regal Australia sources products from Regal manufacturing facilities and represents some of the world’s leading industrial manufactures.

Regal Australia embraces the company core values of Integrity, High Energy and Performance and has adopted the initiatives of customer care, globalization, innovation, sustainability and simplification.

Our company business statement is that “We convert power into motion to help the world run more efficiently” has direct lineage to our core values and initiatives.

REGAL

OUR CORE VALUES

Integrity

We are a company that is honest, trustworthy, candid, transparent and fair.

High Energy

Our culture promotes a strong work ethic with high energy teams fostering a culture of inclusion and respect for all.

Performance

Everyone is expected to perform and our stakeholders count on us to execute, meet commitments and continuously improve.

REGAL

OUR INITIATIVES

Customer Care

Our future depends on the success of our customers. We will establish closer relationships with our customers, actively listen to their feedback and respond with a sense of urgency.

Globalization

We want to be global for three reasons. First, we want to participate in high growth markets around the world. Second, many of our customers are global and we want to serve customers where they do business. Finally, we want to utilize our global capabilities to seek out the best talent and to remain globally competitive.

Innovation

We will build the future of the Company on products that are new and needed. While we accept that with an innovation headset comes a certain degree of risk, we are committed to investing in new products, technologies and processes that deliver real value to our customers.

Sustainability

The long term sustainability of our Company requires not only continuous growth and profitability, but also that we take personal responsibility for the impact we have on our planet, and for the fair and just treatment of the people we employ.

Simplification

Complexity is a serious disadvantage in business. We aim to simplify every aspect of our operations to eliminate complexities in order to increase our speed, improve our flexibility and reduce our costs.

Introduction

This catalogue details the complete range of Regal Australia HGA series motors. Standard HGA motors are three phase squirrel cage TEFC (Totally Enclosed Fan Cooled), with IEC frame sizes from 80 to 315, with CENELEC frame allocation as standard. They combine excellent electrical characteristics with the robust strength of cast iron.

In addition to standard design, the range includes:

- HGAB** - Brake motors
- HGAE** - Hazardous location Ex e
- HGAN** - Hazardous location Ex nA
- HGAD** - Hazardous location Ex tD
- HGABD** - Hazardous location Ex tD, Brake motors
- HGAS** - Smokespill application
- HGAC** - Cooling tower application
- HGAR** - Airstream rated for Axial flow fans
- HGAHM** - Mining Series

All units are supplied with F Class insulation, with temperature rise being limited to less than 80K (unless otherwise marked). This provides the end user with a wide safety margin under general operating conditions.

In addition we also offer motors wound with H Class insulation, and temperature rise still limited to 80K.

- HGAH** - High ambient temperature application
- HGAHS** - H Class smokespill application

Additional protection is provided by installation of thermistors in all units from 160 frame upward to continuously protect the winding.

The conservative rating of Regal Australia type HGA motors provides additional operational safeguards, ensures long unit life, and renders this series inherently suitable for most arduous mining, industrial or agricultural applications.

Hazardous area certification

HGA motors are certified for use in hazardous locations as per IECEx for Ex e, Ex nA and Ex tD protection. The certificate number is IECEx TSA 06.0034X issue No.4 and covers the following:

Frames	Protection	Location	Amb. Temp.	Enclosure
80 - 280	Ex e II T3	Zone 1	40°C	IP55 (IP66 optional)
80 - 315	Ex nA II T3	Zone 2	50°C	IP55 (IP66 optional)
80 - 315	Ex tD A21 T135	Zone 21	50°C	IP66

The certificate also covers HGA 80 to 132 frame brake motors to Ex tD protection

Efficiency

The HGA range of motors exceed MEPS2 requirements of AS/NZS1359.5:2004 with many sizes meeting High Efficiency levels of the same standard. HGA motors exceed European Eff1 levels and correspond to IE2 (High Efficiency) of the new international standard IEC 60034-30.

Standards and specifications

The main dimensions and rated outputs of Regal Australia type HGA motors generally conform to International Standards IEC60034, IEC60072 and Australian Standard AS1359.

Product code specification

When placing an order the motor product code should be specified. The product code of the motor is composed in accordance with the following example:

M	3	2	0	0	1	5	0	3	H	G	A	E	/	4	0	5
1	2	3	4 - 8					9	10 - 12		13...	Suffix				

Position 1

M = metric frame size

Position 2

Winding design

3 = Standard three phase motors

Position 3

Number of poles

2 = 2 poles

4 = 4 poles

6 = 6 poles

8 = 8 poles

Positions 4 to 8

Rated power output

(kW x 100)

Position 9

Mounting arrangements

1 = V1

3 = B3

4 = B3/B5

5 = B5

6 = B3/B14A

7 = B14A

8 = B3/B14B

9 = B14B

Positions 10 to 12

Series

HGA = Regal Australia HGA series

Positions 13...*

Series variation

Blank = Standard

B = Brake motor

C = Cooling tower motors

D = Ex tD

E = Ex e

F = Flying leads

N = Ex nA

H = Class H insulation

L = Left hand terminal box

M = Mining Spec

R = Airstream rated

S = Smokespill

T = Top terminal box

* Multiple letters indicate multiple variation.

Suffix

Winding design

Blank = 380 - 415V / 50Hz, 440 - 480V / 60Hz

/A05 = 1000V / 50Hz

/386 = 380V / 60Hz

/B05 = 1100V / 50Hz

/525 = 525V / 50Hz

Mechanical design

Mountings

Regal Australia HGA motors are available in the mounting arrangements listed in the table below:

Foot mount

		
B3 (IM1001) [HGA 80 - 315]	V5 (IM1011) [HGA 80 - 280]	V6 (IM1031) [HGA 80 - 280]
		
B6 (IM1051) [HGA 80 - 180]	B7 (IM1061) [HGA 80 - 180]	B8 (IM1071) [HGA 80 - 180]

Large flange

		
B5 (IM3001) [HGA 80 - 250]	V1 (IM3011) [HGA 80 - 315]	V3 (IM3031) [HGA 80 - 180]

Large flange and feet

		
B3/B5 (IM2001) [HGA 80 - 315]	V1/V5 (IM2011) [HGA 80 - 180]	V3/V6 (IM2031) [HGA 80 - 180]

Small flange (face)

		
B14 (IM3601) [HGA 80 - 160]	V18 (IM3611) [HGA 80 - 160]	V19 (IM3631) [HGA 80 - 160]

Small flange (face) and feet

		
B3/B14 (IM2101) [HGA 80 - 160]	V5/V18 (IM2111) [HGA 80 - 160]	V6/V19 (IM2131) [HGA 80 - 160]

Note: Bearing arrangement may require review for vertical shaft mounting.

Protection

For vertically mounted motors

Motors to be mounted with the shaft vertically down must be provided with a suitable cover (available on request) to ensure foreign bodies are prevented from entering the motor.

Special care is necessary in fitting protective covers to ensure air flow is not impeded (refer to Cooling section on page 7).

To maintain IP rating, special additional measures may be required to protect the motor against the ingress of water or foreign bodies. Please contact Regal Australia for further information.

Against solar radiation

High solar radiation will result in undue temperature rise. In these circumstances motors should be screened from solar radiation by placement of adequate sunshades which do not inhibit air flow.

Degree of protection

Standard levels of enclosure protection for all HGA frame sizes for both motor and terminal box is IP55, with IP56, IP65 and IP66 available on request.

Enclosure designations comply with IEC or AS60529. The enclosure protection required will depend upon the environmental and operational conditions within which the motor is to operate.

IP standards explanation

I	P	5	5
1-2	3	4	

Positions 1 and 2

International protection rating prefix

Position 3

First characteristic numeral

Degree of protection of persons against approach to live parts or contact with live or moving parts (other than smooth rotating shafts and the like) inside the enclosure, and degree of protection of equipment within the enclosure against the ingress of solid foreign bodies.

- 4 = *Protected against solid object greater than 1.0 mm:* Wires or strips of thickness greater than 1.0 mm, solid objects exceeding 1.0 mm
- 5 = *Dust protected:* Ingress of dust is not totally prevented but it does not enter in sufficient quantity to interfere with satisfactory operation of the equipment.
- 6 = *Dust tight:* No ingress of dust.

Position 4

Second characteristic numeral

- 4 = *Protected against splashing water:* Water splashed against the enclosure from any direction shall have no harmful effect.
- 5 = *Protected against water jets:* Water projected by a nozzle against the enclosure from any direction shall have no harmful effect.
- 6 = *Protected against heavy seas:* Water from heavy seas or water projected in powerful jets (larger nozzle and higher pressure than second numeral 5) shall not enter the enclosure in harmful quantities.

Materials and construction

Element	Motor frame size	
	80-180	200-315
Frame	Cast iron	Cast iron
Endshields	Cast iron	Cast iron
Terminal box	Cast iron	Cast iron
Fan	Plastic (cast iron optional)	Cast iron
Fan cowl	Sheet steel	Sheet steel
Fasteners	Corrosion protected	Corrosion protected

Shaft

HGA motors have standard shaft extension lengths and are provided with standard key, and drilled and tapped hole. Non standard shaft extensions are available upon special order, with shaft design outlined on a detailed drawing.

Shaft extension run out, concentricity and perpendicularity to face of standard flange mount motors, comply with normal grade tolerance as specified in IEC 60072-1 and AS1359. Precision grade tolerance is available upon special order.

Finish

Standard HGA motor color is RAL 7030 Stone Grey. Other colors are also available. All castings and steel parts are provided with a prime coat of rust-resistant paint.

The finishing coat of enamel paint is sufficient for normal conditions, however special paint systems can be provided to accommodate stringent requirements for motors in corrosive environments. Special coatings are needed to resist such substances as acid, salt water and extreme climatic conditions.

Different colors and paint systems apply for varieties as described later in this catalogue.

Terminal box

HGA motors have a cast iron terminal box with a one piece nitrile rubber barrier gasket between terminal box and motor, and a flat gasket under the terminal box lid. The earthing arrangement is available within the terminal box.

As standard the terminal box is mounted on the right hand side when viewed from drive end. Motors are also available with terminal boxes on the left hand side or top.

→ indicates conduit entry position

Conduit entries for motor frame sizes 80 to 280 are provided tapped, with thread details set out below. Motor frame size 315 is provided with a blank removable gland plate for machining as required.

¹⁾ Dimension LT should be confirmed for HGAL motors.

Motor frame	Dimensions			Entry/pitch	
	HF	HG	LT ¹⁾	Standard	Number of entries
80 ²⁾	127	135	40	M20 x 1.5	2
90S ²⁾	127	135	45	M20 x 1.5	2
90L ²⁾	127	135	60	M20 x 1.5	2
100L	135	127	75	M20 x 1.5	2
112M	135	127	80	M25 x 1.5	2
132S	135	127	100	M25 x 1.5	2
132M	135	127	120	M25 x 1.5	2
160M	200	175	65	M32 x 1.5	2
160L	200	175	90	M32 x 1.5	2
180M	200	175	65	M40 x 1.5	2
180L	200	175	65	M40 x 1.5	2
200	240	195	55	M50 x 1.5	2
225	240	195	90	M50 x 1.5	2
250	270	235	95	M50 x 1.5	2
280	270	235	90	M50 x 1.5	2
315	355	300	90	10 mm Gland plate	Nil/2

¹⁾ Dimension LT should be confirmed for HGAL motors.

²⁾ Conduit entry faces to rear of motor for frames 80 & 90.

For details of motors fitted with extended leads please refer to page 29.

The terminal box can be rotated through 4 positions, 90° apart. Terminal boxes are fitted with conduit entries arranged as follows:

HGA - Standard²⁾

HGAR - Rear

HGAT - From RHS when viewed from drive end

²⁾ Conduit entry faces to rear of motor for frames 80 & 90.

Cooling

HGA motors are totally enclosed fan cooled (TEFC) over an externally ribbed frame, with free movement of internal air by rotation of rotor blades, which is in accordance with IC0141 of IEC 60034-6 and AS1359.106.

Cooling air flows from the non-drive-end to the drive end. The fan is independent of the direction of rotation of the motor.

When the motor is installed care should be taken not to impede the air flow into the motor cowl. As a guide the following minimum dimension BL should be adopted.

Motor frame	Dimension BL [mm]
80-100	15
112-132	30
160-180	40
200-280	50
315	65

Bearings

As standard, frame sizes 80 to 180 have high quality deep groove sealed ball bearings. Bearings are prepacked with grease which, under normal operating conditions, provide a high degree of operational reliability. Frame sizes 200 to 315 have high quality bearings with facilities to enable replenishment of the lubricant during operation. Grease nipples are fitted to endshields with the grease relief chute blanked off by a removable plate.

The table below sets out the permissible forces that can be applied to the motor shaft. Values assume the occurrence of only radial or axial loading. Point of application of the force is assumed to be at the tip of the shaft. Rotor weights have already been allowed for in the calculation of radial and axial loads. These loads are applicable for horizontal mounting only. The values are calculated on the basis of basic rating life or fatigue life L_{10} of 40,000 hours. Adjusted rating life for specific applications can be calculated if all influencing factors are known.

Greater axial forces can be tolerated if the motors are provided with angular contact ball bearings. Note that in such cases, the axial force must operate in one direction.

Bearing arrangement should be reviewed for motor frame sizes 200 and above if they are vertically mounted. Please contact Regal Australia for further information.

High capacity bearings

For frame sizes 200 to 280 in applications with increased radial force, cylindrical roller bearings can be substituted for ball bearings at the drive end, according to the accompanying table. When a roller bearing is fitted to the D-end, the N-end ball bearing is locked with a circlip to prevent axial movement. Note that the use of roller bearings is not recommended for 2 pole motors.

Permissible radial force - high capacity

Motor frame	D-end Roller	N-end Ball	Permissible radial force [N]		
			4 pole	6 pole	8 pole
200	NU312	6312	5825	6730	7455
225	NU313	6313	6015	7055	7740
250	NU314	6314	7295	8420	9315
280	NU317	6317	13445	15320	16770

Lubrication

HGA motors standard bearings are lubricated with lithium based rolling contact bearing grease suitable for operation within the cooling air temperature range of -20°C to +55°C. For operation outside this temperature range special lubricants are required. HGAH, HGAS and HGAHS motors use Magnalube G grease.

Special lubricants or additional maintenance may be required in the case of motors exposed to comparatively high degrees of pollution, high humidity, increased or changed bearings loads, or prolonged continuous operation.

Permissible radial and axial forces – standard B3 mounted motors

Motor frame	Bearing		Permissible radial force [N]				Permissible axial force [N]			
	D-end	N-end	2 pole	4 pole	6 pole	8 pole	2 pole	4 pole	6 pole	8 pole

Vibration, balancing and noise

Vibration

HGA motors fall within the Level N (normal) limits of vibration severity set out in standards IEC 60034-14:1996 and AS1359.114 (which are listed in the table below). As specified in the standards, these values relate to rotating machinery measured in soft suspension.

Vibration severity limit, Level N

Motor frame	Maximum RMS vibration velocity [mm/s]
80	1.8
90	1.8
100	1.8
112	1.8
132	1.8
160	2.8
180	2.8
200	2.8
225	2.8
250	3.5
280	3.5
315	3.5

Balancing

Rotors have been dynamically balanced with a half key. Pulleys or couplings used with motors must also be appropriately balanced.

Noise

Noise levels for HGA motors comply with limits set by IEC 60034.9 and AS1359.109. HGA sound pressure levels at 1 metre are set out in the table (above right). Data relates to motors tested at no load.

Sound pressure level

Output [kW]	Sound pressure level dB(A) at 1 metre			
	3000 r/min	1500 r/min	1000 r/min	750 r/min
0.75	65	61	59	56
1.1	65	61	60	56
1.5	69	61	60	56
2.2	69	63	60	56
3.0	72	63	64	59
4.0	72	67	64	59
5.5	76	68	68	65
7.5	76	71	68	65
11	80	72	70	65
15	80	74	70	67
18.5	80	74	70	67
22	85	74	70	68
30	87	76	73	70
37	87	76	73	70
45	89	76	76	70
55	89	78	76	74
75	91	81	78	76
90	91	81	78	76
110	92	84	79	76
132	92	86	80	-
160	92	87	-	-

Electrical design

As standard, HGA motors have the following design and operating parameters. Performance data is based on this standard. Any deviation should be examined and performance values altered in accordance with the information provided in this section.

Three phase, 380 - 415V/ 50Hz, 440 - 480V/ 60Hz

Ambient cooling air temperature, 40°C

Altitude - 1000m

Duty cycle - S1 (continuous)

Rotation - Clockwise viewed from drive end

Connection - 230V Delta/400V Star (3kW and below)

- 400V Delta/690V Star (4kW and above)

Nameplate Design

Standard HGA motors are suitable to operate at 380-415V 50Hz and 440-480V 60Hz supplies. This is indicated on the standard nameplate design as shown below.

Motors 3kW and below:

CMG AUSTRALIA		THREE PHASE ASYNCHRONOUS MOTOR				CE	
		TYPE HGA100LB-4				IEC 60034	
DUTY	S1	INS. CL.	F	IP	55	EFF1

480V 60Hz	120	120	100	105	100	100	103

Note: This table is not applicable for hazardous area motors

- ¹⁾ I_N = Full load current T_N = Full load torque
 I_L/I_N = Locked rotor current/ full load current T_L/T_N = Locked rotor torque/ full load torque
 T_B/T_N = Breakdown torque/full load torque

Alternative supplies

HGA motors can be manufactured for any voltage between 100V and 1100V and frequencies other than 50Hz. In case motor winding is designed for a specific voltage x, performance data will be in line with standard 400V data except current which is calculated with the following formula:

$$I_x = \frac{400 \times I_N}{U_x}$$

Where:

I_x = Current

I_N = Full load current at 400 volt

U_x = Design voltage

Temperature and altitude

Rated power specified in the performance data tables apply for standard ambient conditions of 40°C at 1000m above sea level. Where temperature or altitude differ from the standard, multiplication factors in the table below should be used.

Ambient temperature	Temperature factor	Altitude above sea level	Altitude factor
30°C	1.06	1000m	1.00
35°C	1.03	1500m	0.98
40°C	1.00	2000m	0.94
45°C	0.97	2500m	0.91
50°C	0.93	3000m	0.87
55°C	0.88	3500m	0.82
60°C	0.82	4000m	0.77

$$\text{Effective Power} = \text{Rated Power} \times \text{Temperature Factor} \times \text{Altitude Factor}$$

Example 1

Effective Power required = 15kW
 Air temperature = 50°C (factor 0.93)
 Altitude = 2500 metres (factor 0.91)

$$\text{Rated power required} = \frac{15}{0.93 \times 0.91} = 17.7\text{kW}$$

The appropriate motor is one with a rated power above the required, being 18.5kW.

Example 2

Rated power = 11kW
 Air temperature = 50°C (factor 0.93)
 Altitude = 1500 metres (factor 0.98)

$$\text{Effective Power} = 11 \times 0.93 \times 0.98 = 10.0\text{kW}$$

Rotation

For clockwise rotation, viewed from drive end, standard three phase HGA and HGAT motor terminal markings coincide with the sequence of the phase line conductors.

For counter clockwise rotation, viewed from drive end, two of the line conductors have to be reversed. This is made clear in the accompanying table.

Terminal box location (viewed from drive end)	Sequential connection of L1, L2 and L3	Direction of rotation
Right or Top	U1 V1 W1 V1 U1 W1	Clockwise Counter-clockwise
Left	V1 U1 W1 U1 V1 W1	Clockwise Counter-clockwise

Non-standard HGAL series motors with the terminal box located on the left, viewed from drive end, have a counter-clockwise rotation for corresponding markings. Reversing two of the line conductors will reverse the rotation to clockwise.

Duty

HGA motors are supplied suitable for S1 operation (continuous operation under rated load). When the motor is to operate under any other type of duty the following information should be supplied to determine the correct motor size:

- Type and frequency of switching cycles as per duty factors S3 to S7 and duty cycle factor.
- Load torque variation during motor acceleration and braking (in graphical form).
- Moment of inertia of the load on the motor shaft.
- Type of braking (eg mechanical, electrical through phase reversal or DC injection).

Permissible output

Apply the factors in the accompanying table to the output rating for motors with duty cycles that are not continuous.

		Duty cycle factor		
		For frames 80 to 132	For frames 160 to 250	For frames 280 to 315
Short-time duty, S2				
30 min	2	1.05	1.20	1.20
	4 to 8	1.10	1.20	1.20
60 min	2 to 8	1.00	1.10	1.10
Intermittent duty, S3				
15%	2	1.15	1.45	1.40
	4 to 8	1.40	1.40	1.40
25%	2	1.10	1.30	1.30
	4 to 8	1.30	1.25	1.30
40%	2	1.10	1.10	1.20
	4 to 8	1.20	1.08	1.20
60%	2	1.05	1.07	1.10
	4 to 8	1.10	1.05	1.10

For other duties (S4, S5, S6 and S7) contact Regal Australia for appropriate duty cycle factors.

Duty cycles

S1 Continuous duty

Operation at constant load of sufficient duration for thermal equilibrium to be reached.

S2 Short - time duty

Operation at constant load during a given time, less than that required to reach thermal equilibrium, followed by a rest (de-energised) period of sufficient duration to allow machine temperatures to reduce to within 2K of the rated inlet coolant temperature.

S3 Intermittent periodic duty with insignificant starting time

A sequence of identical duty cycles where each consists of a period of operating at constant load and a period at rest. The cycle is such that the starting current does not significantly affect the temperature rise.

S4 Intermittent periodic duty with significant starting time

Sequence of identical duty cycles where each cycle consists of a significant period of starting, a period of operation at full load and a period of rest.

S5 Intermittent periodic duty with influence of running up period and electric braking

As S4, but with each cycle including a period of rapid electric braking.

S6 Continuous periodic duty

A sequence of identical duty cycles, each cycle consisting of a period of operation at no-load. There is no rest or de-energised period.

S7 Continuous periodic duty with starting and electric braking

As S6, with each cycle including a period of starting and a period of electric braking.

Connection

A motor's rated voltage must agree with the power supply line-to-line voltage. Care must therefore be taken to ensure the correct connection to the motor terminals.

Internal connections, voltages and VF drive selection

Standard terminal connections for motors 3.0kW and below is 230V delta / 400V star. These motors are designed for 400V Direct On Line (D.O.L.) starting, when connected in the star configuration. They are also suitable for operation with 230V three phase variable frequency drives, when connected in the delta configuration.

Standard terminal connections for motors 4.0kW and above is 400V delta / 690V star. These motors are designed for 400V Direct On Line (D.O.L.) starting, when connected in the delta configuration. They are also suitable for operation with 400V three phase variable frequency drives. Alternatively they can be operated D.O.L. in the star configuration from a 690V supply or with a 690V variable frequency drive. In this case the drive must be supplied with an output reactor to protect the winding insulation. These size motors are also suitable for 400V star-delta starting as described below.

Motor connected for D.O.L. starting with bridges in place for star connection (3.0kW and below)

Motor connected for D.O.L. starting with bridges in place for delta connection (4.0kW and above).

Starting

All of the following starter options are available through Regal Australia Drives division, and are best supplied together with the motor.

D.O.L. Starters

When an electric motor is started by direct connection to the power supply (D.O.L.), it draws a high current, called the 'starting current', which is approximately equal in magnitude to the locked rotor current I_L . As listed in the performance data, locked rotor current can be up to 8 times the rated current I_N of the motor. In circumstances where the motor starts under no load or where high starting torque is not required, it is preferable to reduce the starting current by one of the following means.

Star - Delta starting

HGA motors 4.0kW and above are suitable for the star-delta starting method. Through the use of a star-delta starter, the motor terminals are connected in the star configuration during starting, and reconnected to the delta configuration when running.

The benefits of this starting method are a significantly lower starting current, to a value about 1/3 of the D.O.L. starting current, and a corresponding starting torque also reduced to about 1/3 of its D.O.L. value. It should be noted that a second current surge occurs on changeover to the delta connection. The level of this surge will depend on the speed the motor has reached at the moment of changeover.

Electronic soft starters

Through the use of an electronic soft starter, which controls such parameters as current and voltage, the starting sequence can be totally controlled. The starter can be programmed to limit the amount of starting current. By limiting the rate of the current increase the startup time is extended. This starting method is particularly suitable for centrifugal loads (fans and pumps).

VVVF Drives

The HGA motor performs excellently without cogging at low speed when operating in conjunction with a VVVF (Variable Voltage Variable Frequency) drive. VVVF drives are primarily recognized for their ability to manipulate power from a constant 3 phase 50/60Hz supply converting it to variable voltage and variable frequency power. This enables the speed of the motor to be matched to its load in a flexible and energy efficient manner. The only way of producing starting torque equal to full load torque with full load current is by using VVVF drives. The functionally flexible VVVF drive is also commonly used to reduce energy consumption on fans, pumps and compressors and offers a simple and repeatable method of changing speeds or flow rates.

For operation below 25Hz motor cooling fan efficiency drops significantly. Hence, in constant torque applications, a separately driven cooling fan should be fitted to provide sufficient cooling of the motor.

For operation between 25Hz and 50Hz speed range the motor is capable of delivering full rated torque with its standard fan.

For operation above 50Hz, all HGA motors are capable of delivering constant rated power up to 60Hz. However, most of these motors are suitable to run and deliver constant power at much higher frequencies than 60Hz to a maximum of 100Hz. In the case of applications between 60Hz and 100Hz please contact Regal Australia for advice on suitability.

The HGA range of motors will operate without modification on VVVF drives however under certain conditions additional features should be considered (see EDM Concerns). The graph below shows the HGA motors' loadability with a frequency converter:

EDM concerns

Capacitive voltages in the rotor can be generated due to an effect caused by harmonics in the waveform causing voltage discharge to earth through the bearings. This discharge results in etching of the bearing running surfaces. This effect is known as Electrical Discharge Machining (EDM). It can be controlled with the fitment of appropriate filters to the drive.

To further reduce the effect of EDM, an insulated non drive bearing can be used. Regal Australia recommends the use of insulated bearings for all motors 315 frame.

Insulation

Standard HGA series motors are wound with F class insulation and winding designs limit the temperature rise to 80K (unless otherwise noted) for which B Class insulation would normally be sufficient. The use of F class insulation provides an additional safety margin of 25K, as shown in the accompanying table, together with an extended operating life.

	Insulation class		
	B	F	H
Max. permissible winding temp. (°C)	130	155	180
Less ambient temp. (°C)	- 40	- 40	- 40
Less hotspot allowance (K)	- 10	-10	- 15
Equals max. permissible temp.rise (K)	80	105	125
Less max. design temp. rise (K)	- 80	- 80	- 80
Equals min. safety margin (K)	-	25	45

The HGAH version will provide a safety margin of 45K and can be safely operated at elevated ambient temperatures.

Due to their conservative design many sizes in the HGA range of motors have temperature rises considerably less than 80K and therefore provide even greater safety margins.

Thermal protection

Motors can be protected against excessive temperature rise by inserting, at various positions within the windings, thermal probes which can either give a warning signal or cut off the supply to the motor in the event of a temperature abnormality.

The units fitted to HGA motors, frame sizes 160 and above, are PTC thermistors. These thermovisible resistors, with positive temperature co-efficient, are fitted one per phase, series connected and are terminated in a terminal strip located in the terminal box. Trip temperature is 160°C (180°C for HGAH series). Additional 130°C thermistors can be fitted as an option for alarm connection.

Speed at partial loads

The relationship between motor speed and degree of loading on an HGA motor is approximately linear up to the rated load. This is expressed graphically in the accompanying drawing.

Where:

n_N = full load speed
 n_s = synchronous speed
 P/P_N = partial load factor

Current at partial loads

Current at partial loads can be calculated using the following formula:

$$I_x = \frac{P_{out_x}}{\sqrt{3} \times U_N \times \cos \phi_x \times \eta_x} \times 10^5$$

Where:

I_x = partial load current (amps)
 P_{out_x} = partial load (kW)
 U_N = rated voltage
 $\cos \phi_x$ = partial load power factor
 η_x = partial load efficiency (%)

Torque characteristics

Typical characteristics of torque behaviour relative to speed are shown in the torque speed curve example below.

Where:

T_N = full load torque
 T_L = locked rotor torque
 T_U = pull-up torque
 T_B = break down torque
 n_N = full load speed
 n_s = synchronous speed

HGA motors all exceed the minimum starting torque requirements for Design N (Normal torque) as specified in IEC60034-12, and in most cases meet the requirements of Design H (High torque).

Rated torque can be calculated with the following formula:

$$T_N = \frac{9550 \times P_N}{n_N}$$

Where:

T_N = full load torque (Nm)
 P_N = full load output power (kW)
 n_N = full load speed (r/min)

Installation, operation & maintenance

For a copy of the HGA Installation, Operation & Maintenance manual, please contact Regal Australia or download from our website at www.Regalaustralia.com

Slide rails

Slide rails are designed for motor position adjustment when belt drives are used. Applications include tension adjustment for belt driven equipment.

Regal Australia stock slide rails to suit frame sizes 80 to 315. Rail sets are manufactured from cast iron and provided with mounting bolts and nuts between motor and rail.

Mining Motors – HGAHM

HGAHM mining motors are specifically developed for use in harsh environments typical in mining applications and offer high operational reliability due to increased mechanical & electrical features.

HGAHM motors are available in frame sizes 80 to 200, and rated power outputs of 0.75kW to 30kW.

Electrical Design

HGAHM electrical design is identical to that of HGA series; please refer to the HGA performance data as detailed on pages 16 to 19 of this catalogue.

Dimensions

Please refer to pages 24-26 of this catalogue.

Protection

Regal Australia HGAHM motors have a protection rating of IP66 for maximum protection against water and dust.

Additional Enhancements

- Two part epoxy coating system for corrosive solids and liquids
- Stainless steel name plate
- Class H insulation for increased thermal capacity
- Cast iron fan
- Over size terminal box
- Sintered bronze porous drain plugs
- Gamma seals fitted to DE/NDE
- Re-greasable bearings 160 frame & above
- Thermistors fitted to 160 frame & above
- Auxiliary terminal box (thermistors) fitted to 200 frame
- Provision to fit MEPA 10 vibration studs to 160 frame & above

Paint

The standard paint finish for HGAHM series is two part epoxy with final colour being RAL 2008 (Bright Red Orange)

Bearing Table

Motor frame	Drive End		Non-Drive End

Airstream rated motors for axial fans

Regal Australia offer a comprehensive range of motors specifically built for use with axial flow fans, where the motor is mounted in the airstream.

Provided the airstream ensures ample cooling, the fan and cowl normally fitted to a standard TEFC motor is redundant. Enclosure rating of the motor is also improved with the use of a solid rear endshield.

Due to the elimination of losses associated with the motor fan these motors have a higher efficiency than standard HGA motors.

Standard mount - HGAR (B3, B5, B3/B5)

*2 pole motors only

Motor frame	Dimension [LR]	Motor frame	Dimension [LR]	Motor frame	Dimension [LR]

112M	390	225M	750	315L	1150
132S	400	250M	825		
132M	440	280S	890		
160M	540	280M	940		
160L	585	315S*	1020		

HGARF is a popular alternative to HGAR, with the terminal box replaced by blanking plate and extended leads (see page 29 for details on blanking plates and extended leads). In this case, terminal box and block are supplied loose with motor for convenience of remote leads termination. These motors are also available in H class insulation (HGARHF).

Cooling tower - HGAC

HGAC (formerly HGACT) cooling tower motors are specially developed for operation in air stream rated cooling towers. HGAC motors are available in frame sizes 80 to 315, and rated power outputs of 0.75 to 160kW.

Applications

HGAC motors are ideally suited to the cooling tower application, in industries such as food and beverage, airconditioning, chemical processing, and petrochemical.

Protection

Regal Australia HGAC motors have a protection rating of IP66 for maximum protection against water and dust.

Additional enhancements

- 2 part epoxy coated for excellent protection against corrosive solids and liquids
- Stainless steel name plate
- Corrosion protection on threads
- Extra insulation coating (Red Isonel 300)
- Shaft seal fitted
- Silastic sealed
- Non-drive end shaft extension cut and blanking plate fitted. Alternatively, HGAR used as base motor.

Paint

Standard paint finish for HGAC motors is a 2 part epoxy RAL 9005 Jet Black paint. Regal Australia's HGAC range of cooling tower motors combine the HGA's standard high strength and high efficiency with significant enhancements to give the perfect motor for cooling tower applications.

Smokespill - HGAS/HGAHS

Smokespill application motors are designed to withstand the extreme environmental conditions associated with a building fire. Ventilation systems within public buildings are required to continue providing smoke extraction for 2 hours at smokespill air temperature of 200°C or for 30 minutes at 300°C, designated respectively as rating-1 or rating-2 in accordance with AS/NZS1668.1.

The standard HGAS range, wound with F class insulation in frame sizes 80A to 180L, meet the rating-1 requirements. HGAHS range, wound with H class insulation in frame sizes 80A to 315L, meet either rating-1 or rating-2 requirements. HGAHS range is also suitable for applications at 300°C for 2 hours.

Smokespill features

The standard HGA motor is inherently suitable for upgrading to the smokespill application due to its low temperature rise. When HGAS motors are ordered F class motors are modified and when HGAHS motors are ordered H class motors are modified in accordance with our standard operating procedures which include the following:

- C3 internal clearance bearings lubricated with extra high temperature specification grease
- Special name plate specifying smokespill suitability
- Double insulated terminal leads
- Double varnish system for winding crown
- Fan and cowl removed if present on the original motor; cowl may sometimes remain to protect from bare shaft
- Motors tested prior to despatch
- Extra High Temperature Grease (Magnalube G)

Certification and testing

Australian standard AS4429 specifies the methods of test and rating requirements for smokespill fans. A range of motors was selected in consultation with a competent authority on this subject. Testing of motors was carried out in a specially designed re-circulating duct system. The test rig and the methods of test were also witness approved by a competent authority. A series of tests were conducted to certify our entire range of HGAS and HGAHS motors.

T.E.A.S.R. (Totally Enclosed Air Stream Rated - no fan or cowl)

The HGAS range is normally supplied without fan and cowl, relying on the air flow generated by the driven fan to provide the necessary cooling during normal operation thereby ensuring high temperature operation will not cause the plastic fan to melt.

Motors are normally supplied with the non drive end stub shaft exposed, as it is expected to be shrouded by the fan housing and duct work when installed. If this presents a problem in a specific application, either removal of this shaft can be requested, or the standard fan cowl can be fitted, but without the motor fan. Alternatively the HGAR series can be used as the base motor.

Terminations

HGAS motors can be supplied either with terminal boxes or with extended leads through a gland plate (see page 29 for details). In either case, it is the installers responsibility to ensure that suitable high temperature leads, conduit and fittings are installed to take the motor leads outside the fan case. Regal Australia can supply terminal boxes and terminal blocks for installation outside the fan drum if required.

Paint

Standard color finish for the HGAS range is RAL 7012 Basalt Grey, and RAL 3000 Flame Red for the HGAHS range. Other colors are available on request.

Nameplates

Regal Australia Smokespill motors are marked with special nameplates labelling its suitability for smokespill duty and stating specific temperature condition ratings and lubrication details. Additional plates for external mounting to fan assemblies are available on request.

Maintenance

Because of the safety related nature of smokespill motors proper maintenance schedules are imperative, especially where the motor is used for dual purposes ie. continuous running for normal ventilation as well as for smokespill application. Serious consideration needs to be given to bearing and insulation deterioration caused by use for extended periods for normal ventilation duty. It is important that the motor remains within its stated rating both on initial commissioning and after any adjustments to the ventilation system.

Brake motors - HGAB

Regal Australia offer a wide range of Brake motors, HGAB, from frame size 80 through to 180. 4 pole models are stocked as standard. 2,6 and 8 pole and other non-standard sizes and speeds are available on special order.

HGAB brake motors are “fail to safe” design, as the brake will engage when power is interrupted.

Brake motors are designed for use in applications requiring rapid stopping, holding and position control.

HGAB motors are available in all mounting arrangements. Brakes are made to the ‘Euro’ standard mounting dimension, providing interchangeability with other brands. Cast iron brake enclosures for hazardous locations are also available.

Dimensions

The only dimensional variations of HGAB from HGA is the overall motor length, due to the extended length of the cowl. These dimensional variations are listed in the accompanying table. Overall length L is replaced by LB.

Motor frame	Brake motor overall length [LB]
80	360
90S	395
90L	420
100L	480
112M	525
132S	570
132M	615
160M	700
160L	745
180M	790
180L	830

Connection

HGAB motors 3kW and below are connected in 415V star connection with brake connected as shown below left. HGAB motors 4kW and above are connected in 415 volt delta connection with brake connected as shown below right.

The HGAB 3 phase motor is fitted with a CE certified DC brake and half wave rectifier mounted in the terminal box enabling direct connection of the brake to the AC supply.

Where response time is important, this time can be improved by switching the brake on the DC current side of the rectifier. These additional terminals are standard on the rectifier fitted to the 160 to 180 frame motors as shown below.

Brake details

Output kW	Motor frame	Brake model	Brake weight [kg]	Motor full load torque T_N [Nm]	Brake torque [Nm]			Brake torque [% of full load]		
					Nominal	Min	Max	Nominal	Min	Max
0.75	80B-4	M8	1.8	5.0	8	2.8	10	160%	50%	200%

For further technical details regarding the brake, please contact your nearest Regal Australia office.

Motors for hazardous areas

HGAE/HGAN/HGAD

Motors used within a hazardous location require a higher level of protection against the risk of harmful occurrences. Regal Australia HGA motors are available in the three most common high protection configurations, Ex e, Ex nA and Ex tD, supplied with protection ratings IP55, IP65 or IP66. HGA Hazardous area motors are available in motor frame sizes 80 to 315, with 315 frame available Ex nA and Ex tD only. Combinations of protection such as Ex e and Ex tD or Ex nA and Ex tD are also available.

International and Australian standards

IEC or AS/NZS 61241.1 specify general requirements for the selection of electrical equipment, and its installation and maintenance to ensure safe use in areas where flammable materials are generated, prepared, processed, handled, stored or otherwise used, and which are therefore potentially hazardous.

The term 'flammable material' includes gases, vapors, liquids, mists, solids and dusts, but does not include those materials which are specifically manufactured as explosives or materials which are inherently explosive. The requirements of the listed standards apply only to the use of electrical equipment under normal or near normal atmospheric conditions.

The requirements specified for hazardous location electrical equipment are supplementary to and not alternative to any requirements which would apply to equipment and installations in non-hazardous areas (see AS/NZS3000).

Paint

Standard color finish for the hazardous area range is RAL 7030 Stone Grey, with primary option of RAL 1004 Golden Yellow for HGAE. Other colors are available on request.

Motor protection types

HGAE - Ex e

Ex e motor protection designates Increased safety as outlined in IEC, EN or AS/NZS 60079-7.

The increased safety (Ex e) type of protection describes electrical equipment that does not produce arcs or sparks in normal service in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

Increased safety (Ex e) motors are suitable for Class I, Zone 1, Group II (A,B&C) hazardous areas, and Regal Australia provides for a temperature class of T3 (200°C) in a 40°C ambient (see next page for explanations of classes, zones and groups).

Ex e Protection - t_E time

t_E time is the time it takes for the stator winding or rotor cage to heat up from normal operating temperature, at the highest permitted ambient temperature, to the highest permitted limit temperature (temperature class), with the rotor locked and the stator winding loaded with the starting current.

For selection and setting of suitable current dependent protection the t_E time and the ratio of locked rotor current to nominal current are used. In the case of a rotor locking, this device must cut off the supply within the specified t_E time, which is listed in the performance data.

HGAN - Ex nA

Ex nA motor protection designates Non-sparking as outlined in IEC, EN or AS/NZS 60079-15. Non-sparking (Ex nA) type of protection describes electrical equipment that, in normal operation, is not capable of igniting a surrounding explosive atmosphere, and a fault capable of causing ignition is not likely to occur.

Non-sparking (Ex nA) motors are suitable for Class I, Zone 2, Group II (A,B&C) hazardous areas, and Regal Australia provides for a temperature class of T3 (200°C) in a 50°C ambient.

HGAD - Ex tD

Ex tD motor protection designates dust-excluding ignition proofing as outlined in IEC or AS/NZS61241 series of standards.

Dust-excluding ignition proofing (Ex tD) type of protection describes electrical equipment which is enclosed so that it excludes dust, and which will not permit arcs, sparks or heat otherwise generated or liberated inside the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specific dust on or in the vicinity of the enclosure.

Dust-excluding ignition proofed (Ex tD) motors are suitable for Zone 21 and 22 dust laden hazardous areas, and Regal Australia provides for a temperature class of T4 (135°C) in a 50°C ambient.

Hazardous area classifications

Hazardous areas fall into two categories; hazards due to flammable gases (vapors or mists), and hazards due to combustible dusts (fibres or particles).

Gaseous hazards

Explosive gas atmospheres are classified into zones based on the frequency and duration of their occurrence as below:

Zone 0: an area in which an explosive gas atmosphere is present continuously, for long periods, or is present frequently.

Zone 1: an area in which an explosive gas atmosphere is likely to occur in normal operation occasionally.

Zone 2: an area in which an explosive gas atmosphere is not likely to occur in normal operation, and if it does occur it will exist for a short period only.

Electrical apparatus for potentially explosive atmospheres is divided into the following groups:

Group I: mines susceptible to fire damp (methane).

Group II: other industries.

High surface temperatures can cause ignition of flammable gases or vapors therefore the surface temperature of equipment in hazardous areas must not exceed the ignition temperature of these gases or vapors.

Group I electrical equipment may not have a surface temperature that exceeds 150°C where coal dust can form a layer, and 450°C for internal surfaces where the above risk is avoided by sealing against ingress or dust.

Group II electrical equipment may not have a surface temperature that exceeds its specified temperature class, as listed in the table below:

Temperature class of electrical equipment	Maximum surface temperature of electrical equipment	Ignition temperature of gas or vapor
T1	≤ 450°C	> 450°C
T2	≤ 300°C	> 300°C
T3	≤ 200°C	> 200°C
T4	≤ 135°C	> 135°C
T5	≤ 100°C	> 100°C
T6	≤ 85°C	> 85°C

Electrical apparatus of Group II may be subdivided according to the nature of the potentially explosive atmosphere for which it is intended.

Group specification and characteristics of some common flammable liquids, gases, and vapors are listed in the table below:

Material	Boiling point [°C]	Flash point [°C]	Ignition temp. [°C]	Gas group
Acetone	56	-20	465	IIA
Acetylene	-83	Gas	305	IIC
Ammonia	-33	Gas	651	IIA
Benzene	80	12	498	IIA
Butane	-1	Gas	287	IIA
Carbon monoxide	-192	Gas	609	IIA
Ethane	-89	Gas	472	IIA
Ethyl alcohol	78	55	363	IIA
Ethylene	-104	Gas	450	IIB
Heptane	98	-4	204	IIA
Hydrogen	-252	Gas	500	IIC
Hydrogen cyanide	26	-18	538	IIB
Methane	-162	Gas	537	IIA
Propane	-42	Gas	432	IIA
Toluene	111	4	480	IIA

Note: The data given in this table is derived from NFPA 325M. Flashpoint is the lowest temperature at which a material gives off sufficient vapor to form an explosive gas/air mixture in the air immediately above the surface.

Equipment within a specific group may only be used within a location with an equal or less level of hazard. Allowable groups are summarized in the table below:

Gas group	Allowable equipment group
IIA	IIA, IIB, IIC
IIB	IIB, IIC
IIC	IIC

Combustible dust hazards

Many dusts which are generated, processed, handled and stored, are combustible. When ignited, they can burn rapidly and with considerable explosive force if mixed with air in the appropriate proportions. Electrical apparatus used in locations where this hazard is present, requires adequate protection so as to reduce the likelihood of ignition of the external explosive atmosphere.

Areas where dusts, flyings and fibres in air occur in dangerous quantities are classified as hazardous and are divided into three zones according to the level of risk.

Zone 20: An area in which combustible dust, as a cloud, is present continuously or frequently during normal operation, in sufficient quantity to be capable of producing an explosive dust/air mixture, and/or where layers of dust of uncontrollable and excessive thickness can be formed.

Zone 21: An area not classified as Zone 20 in which combustible dust, as a cloud, is likely to occur during normal operation, in sufficient quantities to be capable of producing an explosive dust/air mixture.

Zone 22: An area not classified as Zone 21 in which combustible dust clouds may occur infrequently, and persist for only a short period, or in which accumulations or layers of combustible dust may be present under abnormal conditions and give rise to combustible dust/air mixtures. Where, following an abnormal condition, the removal of dust accumulations or layers cannot be assured then the area is to be classified.

Ignition protection is based on the limitation of the maximum surface temperature of the enclosure and on other surfaces which could be in contact with dust and on the restriction of dust ingress into the enclosure by the use of dust tight or dust protected enclosures.

The following table summarizes the relationship between temperature class, surface temperature and cloud or layer ignition temperature (whichever is the lower).

Temperature class of electrical equipment	Maximum surface temperature of electrical equipment	Cloud or layer ignition temperature of dust
T1	≤ 450°C	≥ 500°C
T2	≤ 300°C	≥ 350°C
T3	≤ 200°C	≥ 250°C
T4	≤ 135°C	≥ 185°C
T5	≤ 100°C	≥ 150°C
T6	≤ 85°C	≥ 135°C

Specifications and characteristics of some common combustible dusts are listed in the table below:

Material	Minimum ignition energy [mJ]	Ignition temperature	
		Cloud [°C]	Layer [°C]
Aluminium	15	550	740
Cellulose	80	480	270
Corn	40	400	250
Flax	80	230	430
Polypropylene	30	420	-
Rayon	2400	520	250
Rice	50	440	220
Rubber (synthetic)	30	320	-
Sugar	30	370	400
Wheat flour	50	380	360

Modifications, variations and optional extras

Regal Australia offers an extensive range of variations to the HGA motor series. Other HGA ranges outlined in other sections include:

Brake motors - **HGAB**

Smokespill applications - **HGAS** and **HGAHS**

Airstream motors for axial fans - **HGAR**, **HGARF** and **HGARHF**

Cooling tower motors - **HGAC**

Hazardous area motors - **HGAE**, **HGAN** and **HGAD**

In addition to these motor ranges Regal Australia offer a large array of modifications available on order. These modifications are outlined below.

Terminal box

HGA motors come standard with a terminal box on the right hand side viewed from drive end. The following alternatives are available:

- Left hand terminal box - **HGAL**
- Top mounted terminal box - **HGAT**
- Removed terminal box (fitted with a blanking plate and threaded conduit entry. Extended leads, including earth connector) - **HGAF**

Extended leads: 1.5m
No. of power leads: 3+1 for up to 3kW,
6+1 for 4kW and above

Motor frame	Conduit size
80-132	M25 x 1.5
160-180	M32 x 1.5
200-250	M50 x 1.5
280-315	M63 x 1.5

Bearings

Regal Australia can address applications where bearings need special consideration. Attention may need to be given to the following:

- Bearing monitors
- Alternative bearing types
- Low/high temperature bearing grease
- Oil seals
- Non contact labyrinth seals
- Insulated bearings

Shafts

HGA motors come standard with a single output shaft to standard dimensions. The following alternatives are available:

- Double shaft extension
- Special shaft extension
- Stainless steel shaft material type
- Reduced shafts for geared motors

Environmental considerations

Where environmental factors need special consideration Regal Australia can provide the following modifications:

- Winding temperature monitors and thermistors
- Anti-condensation heaters
- Separately powered cooling fans
- Tropic proofing
- Special paint finish
- Higher International Protection ratings, IP56, IP65 and IP66
- High ambient temperature motors – **HGAH** with H class insulation

Special performance

Regal Australia has the ability to provide HGA motors with special windings. These may include:

- Windings for alternative operating voltages and frequencies.
- Windings designed for increased outputs and short time ratings.
- For higher polarities and multispeed, refer to SGA catalogue

VVVF drives

Two types of VVVF drives kit are available for the HGA range to assist in maintaining satisfactory operation.

VVVF drive kit A - Separately driven cooling fan (230 & 400V)

This fan should be used when the motor speed is required to be reduced below 25Hz in constant torque mode. For centrifugal fan or pump, no separate cooling fan is required. For all other loads refer to the loadability curve in the section on VVVF Drives, refer page 14.

VVVF drive kit B - Standard motor (EDM)

This kit incorporates a single insulated bearing, normally at the non-drive end, designed to remove the effect of electrical discharge through the bearings.

Testing services

Regal Australia can provide both type test certificates and individual motor test reports on any Regal Australia HGA motor. Testing is carried out by Regal Australia in our own NATA and ILAC accredited test laboratory.

Accreditation No. 14396

Type test reports and outline drawings of standard motors are available at www.regalaustralia.com

Marine Approval

Lloyd's Register Type Approval

Lloyd's Register Type Approval is an independent certification service, which is available for a wide range of products used in marine and offshore applications, industrial plants and processes, and the IT sector.

Type Approval raises awareness of key issues and best-practice benchmarks in emerging manufacturing countries and helps to improve product quality.

Purchasers of products need to be confident that the suppliers they select are capable of providing the required standard of components. Regal Australia has always prided itself on a commitment to delivering not only the most suitable product, but the highest standard of product, available for the specific job.

For those Regal Australia products used in marine and offshore applications, a Lloyd's Register Type Approval mark has been awarded. This approval mark encompasses the Regal Australia HGA, HLA, PPA/PPC, SGA and SLA range of motors.

The advertisement features a large image of a red ship at sea in the background. In the foreground, several orange and white electric motors are arranged on a wooden deck. The Lloyd's Register Type Approved logo is in the top right corner. The headline 'TREADING WATER?' is prominently displayed. Below it, there are three columns of text: a long paragraph on the left, a short paragraph in the middle, and a longer paragraph on the right. The bottom of the ad features the 'marathon' logo and 'CMG Motors' text.

TREADING WATER?

As a tough economic climate create storms around all parts of the world, energy efficiency and quality assurance take precedence now more than ever before. Breakdowns, un-sustaining energy consumption and insurance rates are no longer of average concern, but have developed into potential corporate survival crises.

Need a lifebuoy?

Don't fret. With over 60 years manufacturing experience in the electric motor industry, **CMG won't leave you drowning.**

Our recent Lloyd's Register Type Approval is a testament to the quality of our products and manufacturing processes. CMG's ability to produce world class electric motors made readily available, is an assurance of our commitment to the Shipping Industry.
